# Contents

---

- I. Introduction
- II. Overview
- III. Database
- IV. Block Decomposition
- V. Path Decomposition
- VI. Conclusions

# I. Introduction

---

- The global economy has changed patterns of trade and production in unprecedented ways.
- Two of the most salient features of this process are the animating role of private agency and global supply chain decomposition.
- With international capital allocation (FDI) and contracts, private agents have created extremely complex global supply networks
- The corresponding intermediate trade linkages are increasingly responsible for the majority of value creation

# Introduction

---

- They also create the preconditions for independent producer and market development in recipient countries
- To assess these complex, trade mediated interactions, we have developed an international multiplier model based on the GTAP database.
- Decomposition analysis with this model reveals regional trade interactions at unprecedented levels of detail.

# Part II

---

## Overview of Global Supply Networks

# Public Multilateralism: WTO

---

- Great Accomplishments
- Significant Limitations (some only temporary)
  - Imperfect bargaining vehicle
    - quite slow
    - diverse phase-in commitments and exceptions
  - High bindings
  - Evasive protection
    - contingent protection
    - administrative measures

# Public Multilateralism: Bilateral Contagion

---

In part because of its imperfections, the WTO has further promoted liberalism via smaller scale agreements, especially BTAs.

Motives:

- Lock in early WTO gains with neighbors and “like minded” partners
- First-mover advantage for market entry and export access
- Blueprint for WTO accession (China, Vietnam)

# Public Multilateralism: East Asia

---

- In this region, China will probably set the pace with its WTO initiative.
- Other economies in the region will have to come to terms with this, but its emergent internal market represents a great prize for regional exporters.
- This China Bandwagon effect will propagate liberalism across the region, regardless of other country's own WTO strategies.

# Private Multilateralism: The Invisible Handshake

---

- Private agency is redefining trade patterns and economic structure in ways unforeseen by Ricardo
- Unlike official trade negotiation, this process is largely spontaneous and collaborative
- Globalization has been accompanied by an unprecedented proliferation of ownership and contractual networks
- The main catalyst for this process is international capital mobility and FDI

# Private Multilateralism: FDI

---

Global capital allocation, particularly in East Asia, is animated by complex motives:

- Resource costs (the traditional explanation)
- Market access: double targeting
- Proximate markets
- Rent seeking and other institutional imperfections
- Portfolio decisions
  - risk management
  - asset allocation
  - supply chain decomposition

# Supply Chain Decomposition

---

- As global networks expand, supply chains are decomposed into ever smaller and more specialized segments
- Intermediate linkages and intra-industry trade are accelerating much faster than final goods trade
- The entry point for a recipient country in this network depends upon their FDI “readiness”
- To a significant extent this has led an international hierarchy and competition for
  - value added in intermediate production
  - technology acquisition
  - growth externalities

# Bamboo Capitalism

---

- Because of network externalities in local production and finance, complete markets sprout from nodes in a global root system of intermediate supply.
- This culminating aspect of global supply chain decomposition has created a diverse and vibrant population of independent local industries around the East Asian region.
- Many emergent enterprises are still bound to their roots by ownership or contracts
- But increasingly they arise independently, promoting the dynamics of global competitiveness and innovation.

# III. International Database: The Global Trade Analysis Project

---

The GTAP dataset contains, for 66 countries/regions and 57 sectors,

1. National income and product accounts
2. Input-output tables
3. Bilateral trade flow tables
4. Protection and support estimates

for more information, see  
[www.gtap.org](http://www.gtap.org)

# Aggregation

## IV. Block Multiplier Decomposition

---

- While trade flow data are revealing, they only capture direct bilateral effects.
- In the real economy, a myriad of interactions delineate the path from initial expenditure to ultimate incomes.
- This is particularly the case with trade in an era of globalization, where international supply chains are ever more elaborate and indirect linkages can represent the majority of value creation.
- To assess these effects empirically, we use the international SAM for multiplier analysis.

# Social Accounting Matrix

- Consider an example of three countries, each represented by a social accounting matrix of the form

$$T_k = \begin{bmatrix} T_{kk} & F_k \\ V_k & X_k \end{bmatrix}$$

where the component matrices denote commodity flows (T), final demand (FD), value added (VA), and other domestic accounts (X).

# Multilateral Social Accounting Matrix

- Consider SAMs for three countries, compiled into a multilateral transactions table

|                            |                            |                            |       |
|----------------------------|----------------------------|----------------------------|-------|
| $T_{11}$                   | <u><math>T_{12}</math></u> | <u><math>T_{13}</math></u> | $F_1$ |
| <u><math>T_{21}</math></u> | $T_{22}$                   | <u><math>T_{23}</math></u> | $F_2$ |
| <u><math>T_{31}</math></u> | <u><math>T_{32}</math></u> | $T_{33}$                   | $F_3$ |
| $V_1$                      | $V_2$                      | $V_3$                      | $X$   |

where the off-diagonal T matrices (underlined) are bilateral trade flows.

# Block Decomposition

To elucidate **multi-lateral** regional trade linkages, we carry out the following block multiplier decomposition:

|          |          |          |       |
|----------|----------|----------|-------|
| $T_{11}$ | $T_{12}$ | $T_{13}$ | $F_1$ |
| $T_{21}$ | $T_{22}$ | $T_{23}$ | $F_2$ |
| $T_{31}$ | $T_{32}$ | $T_{33}$ | $F_3$ |
| $V_1$    | $V_2$    | $V_3$    | $X$   |

$$M = M_3 M_2 M_1$$

# Block Decomposition (cont.)

$$M_1 = \begin{bmatrix} (I-A_{11})^{-1} & 0 & 0 \\ 0 & (I-A_{22})^{-1} & 0 \\ 0 & 0 & (I-A_{33})^{-1} \end{bmatrix}$$

Linkages

Intra-country

Inter-country (bilateral)

$$M_2 = \begin{bmatrix} I & (I-A_{11})^{-1}A_{12} & (I-A_{11})^{-1}A_{13} \\ (I-A_{22})^{-1}A_{21} & I & (I-A_{22})^{-1}A_{32} \\ (I-A_{33})^{-1}A_{31} & (I-A_{33})^{-1}A_{32} & I \end{bmatrix}$$

Equilibrium Indirect

$$M_3 = \begin{bmatrix} I-D_{12}D_{21}-D_{13}D_{31} & D_{21}D_{12} & D_{31}D_{13} \\ D_{12}D_{21} & I-D_{21}D_{12}-D_{23}D_{32} & D_{23}D_{32} \\ D_{13}D_{31} & D_{23}D_{32} & I-D_{31}D_{13}-D_{23}D_{32} \end{bmatrix}$$

Note:  $D_{ij} = (I-A_{ii})^{-1}A_{ij}$

# Household Income Multipliers

# V. Path Decomposition

- Block decomposition reveals the generic sources, but not the actual bilateral chains of income determination.
- To summarize the methodology:
  - An **arc** is a pair  $\langle i,j \rangle$  of indices in the SAM accounts
  - A **path** is a sequence  $s$  of indices  $s = \langle i,k,l,\dots,m,j \rangle$  decomposable into consecutive arcs  $\langle i,k \rangle, \langle k,l \rangle, \dots, \langle m,j \rangle$ .
  - The influence of  $i$  on  $j$  through path  $s$  is denoted  $(i \rightarrow j)_s$
  - To estimate the income effect along  $\langle i,j \rangle$ , before economywide linkages are taken into account, we have:

$$\frac{\partial y_j}{\partial y_i} = a_{ji}$$

# Path Decomposition

- For any given path  $s = \langle i, k, \dots, m, j \rangle$  the **Direct** income influence the composite

$$D_{(i \rightarrow j)s} = a_{ki} \dots a_{jm}$$

- In any given path  $s$  there may exist feedback effects among its indices, each of which can be represented by a multiplier  $\mu_s$  (actually the  $ji$  entry in the multiplier matrix  $M$ ).
- All of these feedback effects taking place along the path amplify the direct influence to produce **Total** influence:

$$T_{(i \rightarrow j)s} = D_{(i \rightarrow j)s} \mu_s$$

# Path Decomposition

- Finally, note that more than one elementary path may span two indices  $i, j$ . Therefore the **Global** income effect must sum total effects over all paths:

$$G_{(i \rightarrow j)s} = \sum_{s \in S} T_{(i \rightarrow j)s} = \sum_{s \in S} D_{(i \rightarrow j)s} \mu_s$$

- **Direct**, **Total** and **Global** influence are three distinct components that make up the transmission mechanism underlying income determination.

# Example 1: Linkages from Japanese Electronics to Japanese Households

---

- Please see the handout.

## Example 2: Chinese Electronics to Japanese Households

| Path  | Global Effect | Direct Effect | Path Mult | Total Effect | % of Global |
|---|---------------|---------------|-----------|--------------|-------------|
| 1. chn-ele -> jpn-ele -> jpn-Usk -> jpn-hhs             | 3.059         | 0.018         | 13.242    | 0.234        | 7.6         |
| 2. chn-ele -> jpn-ele -> jpn-Skl -> jpn-hhs             |               | 0.011         | 13.242    | 0.144        | 4.7         |

# VII. Conclusions

---

Supply chain decomposition is changing the landscape of East Asian regional:

1. Capital allocation
2. Production patterns
3. Trade
4. The development process

# Capital Allocation

---

FDI over the supply chain is driven by:

- Resource costs (the traditional explanation)
- Market access: double targeting
- Proximate markets
- Rent seeking and other institutional imperfections
- Portfolio decisions
  - risk management
  - asset allocation
  - supply chain decomposition

# Production Patterns: Regional Hierarchy and FDI Competition

---

- Regional hierarchies are being expanded according to the detailed characteristics of FDI.
- Countries are increasingly FDI-quality conscious
- They are competing for FDI with complementary policies toward human capital and infrastructure

# Trade: Multilateralism in Bilateralism

---

- Our results indicate that over one third of total value creation in bilateral ties actually arises from multilateral network linkages.
- This is due mainly to trade in intermediates.
- Intermediate trade is growing faster than final goods trade, and will ultimately dominate as it does in the EU.

# Development Process: Bamboo Capitalism

---

- From the nodes in an ever expanding root system of intermediate supply, independent producers and even complete local markets emerge to join the dynamic of regional competition and innovation.
- Microeconomic replication of this kind is accelerating more balanced growth and overcoming exactly the specialization tendencies dictated by traditional comparative advantage.
